

Chemical Injection Sub

The **BDWS Chemical Injection Sub** is designed to allow the injection of either a de-icing agent (i.e. Methanol or Glycol) or an inhibitor to prevent H₂S/CO₂ corrosion. It is mounted just below the Stuffing Box or Grease Injection Head.

It has replaceable felt packings which are kept constantly wet by chemical injection and therefore act as wipers to the wireline passing through it.

The Chemical Injection Sub can be supplied with various size unions, pressure rating up to 20,000 psi, for Standard and H₂S services and designed to suit larger wire sizes upon request.

FEATURES

- Manufactured from Alloy Steel.
- Supplied with various size of QUN connection.
- 5,000 to 20,000 psi working pressure.
- H₂S or Standard service.
- Pressure test to the required Test Pressure.
- Part Number available upon request.
